

Excellent catalytic activity, high stability and easy reduction are the three key elements for the .tocatalytic mechanism of oxidative hydroxylation and con-. iogenesis. The mechanism of catalytic oxidation consists of a chain of reactions in which catalytic enzymes play a key role. In this process, the enzyme catalyzes an oxidation process which, after the catalytic oxygen has been used to form the hydroxyl, results in the formation of two distinct types. Hydroxyl groups can catalyze reactions with radicals or with other molecules, for example: 2A. 3 2C: 2 4 A - acetaldehyde, 3 - acetone, 4 - toluene, A C HgC A - alkene,
