Aikatsu has taken the TV anime world by storm. Now, the idols are going mobile. Aikatsu Friends!, the long-in-the-works game project from Bandai Namco, is coming to the Nintendo Switch this Fall. Aikatsu Friends! follows the trappings of Bandai Namco's own Aikatsu Friends television anime, and, as you might have guessed, it's mostly about adventure. The game will feature around 30 returning characters, but also introduce new idol characters, new characters, and special collaboration characters. (Collaboration characters are characters that were featured in the Aikatsu Friends! TV anime, and have only been seen on TV, not in the game yet.) The game will feature 30 characters in total. The 20-player character/player ship battle system introduced in the anime returns, as does the 4-4 formation matches. The Battle Card system will also come back. It adds a lot of depth to the skirmishes. It's a card system that will allow one player to have a team of cards, with characters on them, and others to play them to battle. The new additions to the game include such things as functional chat systems, which allow you to discuss your battle cards. You can also have your own cards that you swap in with your team to combat others' teams. There are still many questions about Aikatsu Friends! that have yet to be answered. The IGN report states that Aikatsu Friends! will also include a "life-simulator mode" that, for some reason, has another game included alongside it called Not a particularly great name, but the function it has is that you can go through their life, do typical daily things. There's also a showcase mode where you can check out the characters and see how they perform. There's also a world map that can be accessed from in-game events, and the world map will showcase the performance of your characters. The game is coming to the Nintendo Switch this Fall. The game will include English subtitles. The various problem-solving strategies employed and the operational results obtained with respect to any component parts and/or multi-component assemblies are typically unpredictable and vary greatly. On Monday, July 21, Shamir presented a paper at the 14th International Symposium on Verification, Model Checking and Abstract Interpretation. Titled "A simple and efficient algorithm for arc consistency checking," the work is a follow-up to Shamir's 2009 work that introduced Linear Arithmetic (LA), a model-checking approach that combines abstract interpretation and linear arithmetic. The technique is not only efficient, but also scalable in a larger state-space context. An abstract domain can be seen as a "separation" between a program (the domain itself) and the SAT solver (the concrete domain), and a lower bound on the expressiveness of the abstract domain can be used to upper bound the size of the concrete domain. LA uses a simple mapping from linear arithmetic to a lifted version of the abstract domain. Shamir demonstrates this approach in a Scala setting and also via generic abstraction which means the approach also works for Java, C# and Objective-C. To upper bound the expressiveness of the abstract domain, Shamir also introduces a counter-example-driven technique that he calls "mutation-based" generic abstraction, where a derivation is considered correct when mutation of the abstract state space (including for guards) is unable to remove a counter-example for a derived state. This technique is ideally suited to SAT-based model checking and in fact, Shamir believes that "ideal" SAT solvers may eventually adopt this approach rather than the commonly-used "backtrack" approach where loops are explicitly modeled. In a sense, LA is one of the first "service oriented" model checking approaches, in that it provides a modular approach to model checking. Shamir considers an environment of users interacting with the model as a service that should be able to scale in its role as a model checker. Although Shamir's work is interesting, it's not exactly groundbreaking. The core contribution is the new abstraction which is valuable on its own, but it's not clear yet if this will gain traction in the model-checker community. It's also not clear how well LA scales in practice: the largest published C model has 100 states, but if you use the approach with a superlinear abstract domain (like Total Linear Arithmetic) then you can easily see that something like millions of states are possible. Moreover, the simplicity and efficiency of LA limits
