Message Your comment on 'Ulead Video Studio 11 Plus Free Download Full Version With Registration Code' will be published. This invention relates to the production of swelled starch products. In the past, many processes have been proposed for the production of swollen starch-containing granules (including, for example, U.S. Pat. No. 3,923,822, U.S. Pat. No. 4,205,090, U.S. Pat. No. 4,654,209 and U.S. Pat. No. 4,711,767). These processes generally involve extruding a starch slurry through a die to form an extrudate, which is heated to remove water and any fluid in the extrudate, and dried. The dried extrudate is then simply cooled to cause swelling. Despite such techniques, it has been found that to achieve any of the advantageous attributes of the present invention, the cooling must be carried out in a manner that is not compatible with some of the basic starch characteristics that must be maintained, as well as with the other manufacturing techniques employed. Specifically, in most applications it is desirable to carry out the cooling operation gradually so that the product does not experience any substantial shock during the cooling operation. However, as mentioned above, the cooling must be performed rapidly enough to cause the production of a starch product that is capable of being converted to a foamed product in a short period of time. Thus, the cooling must be more of a gradual process, which is only capable of being carried out over a short period of time. It has been found that the above problems may be overcome by simply extruding a starch slurry in accordance with the present invention and then cooling the resulting extrudate to a temperature that is near the gelatinization temperature of the starch, and in particular near the point where the starch granules become mobile within the extrudate, whereby the starch granules are caused to swell. Such process has been found to produce a starch product that has a number of good attributes, including that the products are capable of being fed into a foaming chamber where foaming is accomplished. In addition, such products are readily dispersible in aqueous media, so that they may be readily mixed with a wide variety

of food products. Accordingly, it is a general object of the present invention to provide a process for the production of a foamed starch product. Another object of the present invention is to provide a
