That is why a mobile version of the program should always have the option of importing and exporting formats. True, photoshop is not the most versatile RAW converter, but if you can't import a RAW file and make a rudimentary edit, then do not even try to assume that you can convert a JPEG to RAW and edit it accordingly. That would simply be ludicrous. And asking the user to import the file and then export the file to the same formats as they originally imported will prevent any mistakes. I am sure that we all know photographers who do not even know the difference between a RAW and a JPEG file. And then worry about the differences. it will be interesting to see what the results are of using Lightroom 5.2 for future reviews. I see a number of you that are serious photographers and have purchased products and would like feedback on what you think about the program. Thanks How does the whole star rating apportionment work? Does this mean that each reviewer has his or her score tallied up, and then this total is divided by the number of reviewers provided by Lightroom? Also, is there any way to make Lightroom not re-import my edits on each re-open? I love this software and would love if it set itself to whatever I had just changed. This is a simple feature and would make my work through it smoother. I have been using Photoshop since version 1 and it's always been my primary image editor. Recently I have switched my work workflow to mainly work on Lightroom as it's faster for editing RAW files and there is a better UI. I work on my images on Lightroom and make adjustments and reposition anything I need to in Photoshop. If there is anything that can be moved back to the Raw Editor for further processing within Lightroom that would be great. The biggest downside I have with Lightroom (if I don't use the side panel to make sure a Photoshop adjustment doesn't revert back to the base image) is when I make an adjustment that causes a focus change (sharpening or applying a vignette) in Photoshop. Lights come back on, I want to go back to a darker image which means I have to use an adjustment to take that back out again. I have to open each adjustment

and go through that or use the video tutorials I have watched to figure out how to right click in the adjustment window and choose move under the text menu for that adjustment. I do like the smart tool which will highlight the color I have modified so I can edit the adjustment to take it back out.

A great idea comes from such a simple feature – compound selections. It's really simple and easy to do. The feature enables you to create selections that are different parts of an image. It is extremely useful when painting on images. If you are familiar with the Select and Delete functionality we previously talked about, using compound selections will not be a mystery at all. Using your Rectangle tool on an image, you can determine what you'd like to use for a selection. When you do this, you create a selection. To unselect something from the Selection tool, hold down the Alt/Command, or Cmd, key to make it so it's not selected. Once you have your selection, you can then make it easier to remove it from the original image. In the example below, I've used the Pen tool to let you see the selection I created on the dog. The main difference in this image is the background color. If you were using watercolor, you'd want to blend the color you want the dog to have. To do this, I'm going to use Layer Masks. They're great at making sure the final layer blends perfectly with the picture. Color Match from various images on your system is a great feature to have. This feature is great for designer's trying to create a cohesive look for their content. When working on multiple projects, this feature allows you to pull from a large library of images that have identical colors in them. Simply launch the Color Match tool and hold down Shift to assign the color values to only a portion of your image. To select the tool, you must have the tool selected and then you can double-click on the color swatch you wish to assign. You can easily select a swatch of any color and colorings. To import images, simply browse to the folder the images are in. Once selected, you can delete the swatches you no longer need. e3d0a04c9c

The first step is to open a new photo in Photoshop by clicking File > New. Anything you create will use this template, which shows the basic structure of a typical image, including the Wrap type dimensions. As you can see, my image won't come to actual size on the canvas until I add some content. Viewing a large proofing window that has been created from an Open As option can be hidden with the menu icon in the top right corner of the Photoshop window. However, as I want to edit this file, I'll stay with the image to work on it in the preview mode. Now that we have opened our image, we need to set a color scheme for the image. We can do this by clicking on Color > Scheme > New Color Scheme, or by simply grabbing a color from the image by holding down a shift key when doing the selection. Once that's done, we want to make sure that the gray levels in the entire image are flat and we need to correct for contrast and brightness at the same time to create a healthy, natural contrast. We can do this by selecting the Layers panel from the menu on the left of the screen and clicking on the downward pointing triangle next to the gray scale. Choose a preset like "(Color) RGB" where you want to set the gray scale. Then, click outside the project area to reset the "don't smooth" indicator in the menu at the top and make sure that the shadows and midtones are clipped for the purposes of the edit. Clipping the different parts of an

image is how we make changes to the entire image and avoid unintended changes.
